MixAll: Learning mixture models

Serge Iovleff

University Lille 1

Abstract

The MixALL package can also be used in order to learn mixture models when the labels class are known. This short vignette assume that you have already read the vignette "Clustering With MixAll" (Iovleff (2016)).

Keywords: R, C++, STK++, Learning, missing values.

1. Introduction

It is possible to perform supervised learning with MixAll when the labels of the individuals are known. Let us recall the notations defined in the Iovleff (2016) vignette. \mathcal{X} denote an arbitrary measurable space, $\mathcal{Z} = \{1, ..., K\}$ is the label set and $(\mathbf{x}, \mathbf{z}) = \{(\mathbf{x}_1, \mathbf{z}_1), ..., (\mathbf{x}_n, \mathbf{z}_n)\}$ represents n independent vectors in $\mathcal{X} \times \mathcal{Z}$ such that each $\Pr(\mathbf{z}_i = k) = p_k$ and such that conditionnally to $\mathbf{z}_i = k$, \mathbf{x}_i arises from a probability distribution with density

$$h(\mathbf{x}_i|\boldsymbol{\lambda}_k,\boldsymbol{\alpha})$$
 (1)

parameterized by λ_k and α .

Given the matrix of obervation \mathbf{x} , and the vector of labels \mathbf{z} , the learning methods will estimate the unknown parameters λ_k and α .

2. Learning with MixAll

Learning analysis can be performed with the functions

- 1. learnDiagGaussian for diagonal Gaussian mixture models,
- 2. learnCategorical for Categorical mixture models,
- 3. learnPoisson for Poisson mixture models,
- 4. learnGamma for gamma mixture models,
- 5. learnMixedData for MixedData mixture models.

These functions have a common set of parameters with default values given in the table 1.

Input Parameter	Description
data	A matrix (or a list of matrix for mixed data) with the data
	to learn.
labels	A vector with the classes of each individuals. Values must
	be between 1 and K .
models	A vector with the models to adjust to each data set in case
	of mixed data, or a set of models to try to adjust. Default is
	cluster*Names() where '*' stands for DiagGaussian, Pois-
	son, Gamma or Categorical.
prop	A vector of size K with the proportions of each class. If
	prop is NULL then the proportions are computed using the
	empirical distribution of the labels.
algo	A string defining the algorithm to use for the missing values.
	Possible values "impute", "simul".
nbIter	maximal number of iteration to perform. Default value is
	100. Note that if there is no missing values, it should be 1.
epsilon	threshold to use in order to stop the iterations (not used by
	the "simul" algorithm). Default value 1e-08.
criterion	A string defining the model selection criterion to use. The
	best model is the one with the lowest criterion value. Possible
	values: "AIC", "BIC", "ICL". Default is "ICL".
nbCore	An integer defining the number of processor to use. Default
	is 1, 0 for all cores.

Table 1: List of common parameters of the learning functions.

The learnKernel function has two more arguments described in table 2.

Input Parameter	Description
kernelName	A string defining the kernel to use. Use a "gaussian" kernel
	by default. Possible values are "gaussian", "polynomial" or
	"exponential".
kernelParameters	A vector with the kernel parameter value(s). Default value
	is 1.

Table 2: List of all the specific parameters of the learnKernel function.

2.1. Learning Multivariate (diagonal) Gaussian Mixture Models

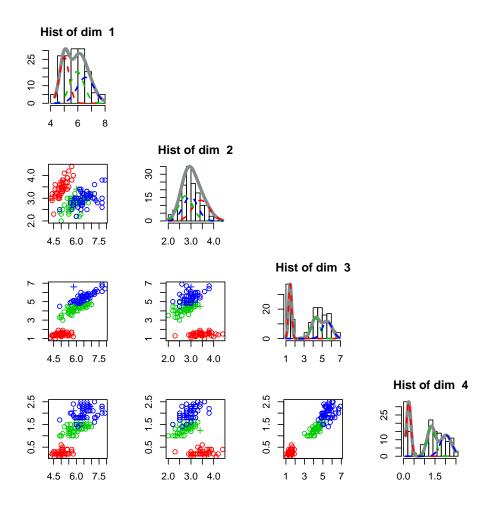

Multivariate Gaussian mixture models (without correlations) can be learned using the learnDiagGaussian function. We illustrate this function with the well known geyser data set (Azzalini and Bowman (1990), Härdle (1991)).

```
> data(iris);
> x <- as.matrix(iris[,1:4]); z <- as.vector(iris[,5]); n <- nrow(x); p <- ncol(x);</pre>
```

```
> indexes <- matrix(c(round(runif(5,1,n)), round(runif(5,1,p))), ncol=2);</pre>
> cbind(indexes, x[indexes]) # display true values
    [,1] [,2] [,3]
[1,]
    29
        4 0.2
         1 7.6
[2,] 106
[3,] 86
        4 1.6
        2 3.0
[4,]
    26
[5,] 142 3 5.1
> x[indexes] <- NA;</pre>
                       # set them as missing
> model <- learnDiagGaussian(data=x, labels = z, models = clusterDiagGaussianNames(prop =
> summary(model)
***********
            = gaussian_p_sjk
* model name
* nbSample
              = 150
* nbCluster
             = 3
* lnLikelihood = -1023.296
* nbFreeParameter= 70
* criterion name = ICL
* criterion value= 2397.336
***********
```

> missingValues(model)

> plot(model)

2.2. Learning Multivariate categorical Mixture Models

Categorical (nominal) data can be learned using the learnCategorical function.

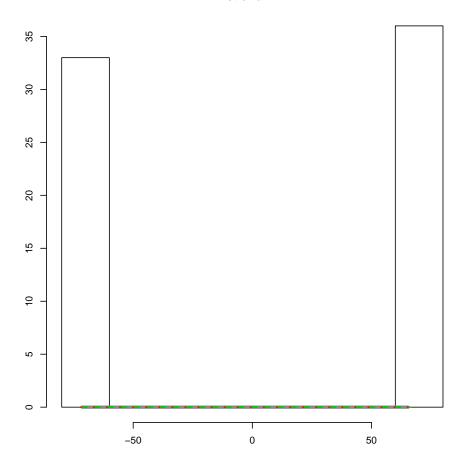

We illustrate this function with the birds data set.

```
> data(birds)
> ## add 10 missing values
> x \leftarrow as.matrix(birds[,2:5]); z \leftarrow as.vector(birds[,1]); n \leftarrow nrow(x); p \leftarrow ncol(x);
> indexes <- matrix(c(round(runif(5,1,n)), round(runif(5,1,p))), ncol=2);</pre>
> cbind(indexes, x[indexes]) # display true values
     [,1] [,2] [,3]
[1,] "14" "2"
                "dotted"
[2,] "14" "3"
                "black & white"
[3,] "58" "3"
                "white"
[4,] "13" "3"
                "black"
[5,] "42" "1"
                "pronounced"
> x[indexes] <- NA;</pre>
                                # set them as missing
> model <- learnCategorical( data=x, labels=z</pre>
```

> plot(model)

```
+
                    , models = clusterCategoricalNames(prop = "equal")
                    , algo="simul", nbIter = 2)
> summary(model)
************
* model name = categorical_p_pjk
************
* nbModalities = 4
***********
* levels =
[1] "none , poor pronounced, pronounced , very pronounced"
[2] "dotted, none "
[3] "black & WHITE, black & white, white "
[4] "few , many, none"
************
          = 69
* nbSample
           = 2
* nbCluster
* lnLikelihood = -553.9514
* nbFreeParameter= 25
* criterion name = ICL
* criterion value= 1213.756
***********
> missingValues(model)
row col value
1 42 1 3
2 14 2
         1
3 13 3 4
4 14 3 4
5 58 3 4
```

2.3. Learning Multivariate Gamma Mixture Models

Gamma data can be learned using the learnGamma function.

We illustrate this function with the iris data set.

```
> data(iris)
> x \leftarrow as.matrix(iris[,1:4]); z \leftarrow as.vector(iris[,5]); n \leftarrow nrow(x); p \leftarrow ncol(x);
> indexes <- matrix(c(round(runif(5,1,n)), round(runif(5,1,p))), ncol=2);</pre>
> cbind(indexes, x[indexes]) # display true values
     [,1] [,2] [,3]
              2 2.9
[1,]
       75
[2,]
              3 5.9
      144
[3,]
      100
              4 1.3
[4,]
                6.0
      120
                 5.3
[5,]
      116
> x[indexes] <- NA;</pre>
                                # set them as missing
> model <- learnGamma( data=x, labels= z,</pre>
                         , models = clusterGammaNames(prop = "equal")
```

```
+ , algo = "simul", nbIter = 2, epsilon = 1e-08
+ )
> summary(model)
```

* model name = gamma_p_ajk_bj

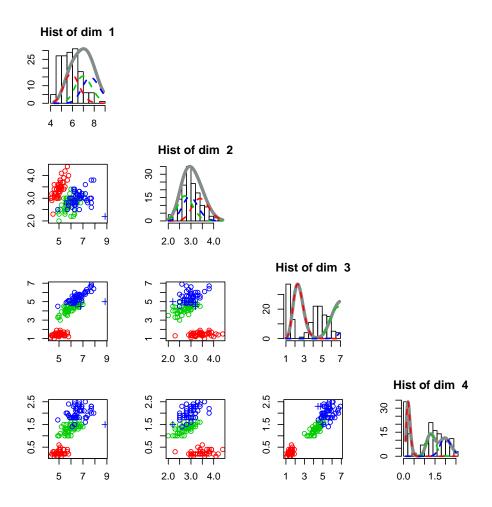

* nbSample = 150 * nbCluster = 3

* lnLikelihood = -15417.01

* nbFreeParameter= 142 * criterion name = ICL

* criterion value= 31545.53

> missingValues(model)

2.4. Learning Multivariate Poisson Models

> data(DebTrivedi)

Poisson data (count data) can be learned using the learnPoisson function.

We illustrate this function with the debTrivedi data set.

```
> x <- DebTrivedi[, c(1, 6, 8, 15)]; z <- DebTrivedi$medicaid; n <- nrow(x); p <- ncol(x);
> indexes <- matrix(c(round(runif(5,1,n)), round(runif(5,1,p))), ncol=2);</pre>
> cbind(indexes, x[indexes]) # display true values
     [,1] [,2] [,3]
[1,] 2550
             3
[2,] 2974
[3,] 1744
             3
                   1
[4,]
             2
       88
                   1
[5,] 1990
> x[indexes] <- NA;</pre>
                               # set them as missing
> model <- learnPoisson( data=x, labels=z</pre>
```

, models = clusterPoissonNames(prop = "equal")

```
+ , algo="simul", nbIter = 2, epsilon = 1e-08
+ )
> summary(model)
```

```
* model name = poisson_p_ljk
```

* nbSample = 4406 * nbCluster = 2

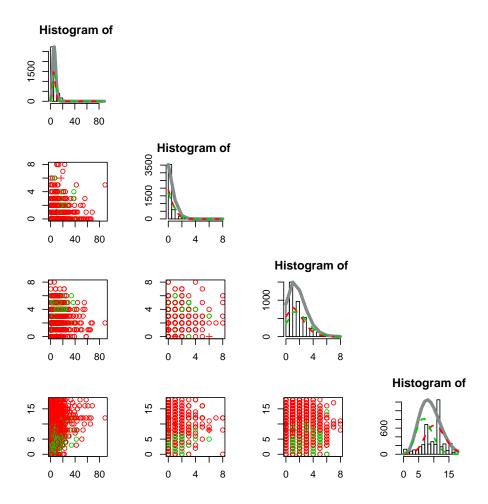

* lnLikelihood = -161275.9

* nbFreeParameter= 17
* criterion name = ICL

* criterion value= 322694.5

> missingValues(model)

```
row col value
1 88 2 1
2 1744 3 1
3 1990 3 2
4 2550 3 0
5 2974 4 8
```

2.5. Learning Mixed data sets

Mixed data sets can be learned using the <code>learnMixedData</code> function. The original mixed data set has to be splited in multiple homogeneous data sets and each one associated to a mixture model name.

We illustrate this function with the HeartDisease data set.

```
* nbCluster = 5
```

* lnLikelihood = -7531.688

* nbFreeParameter= 129 * criterion name = ICL

* criterion value= 15800.45

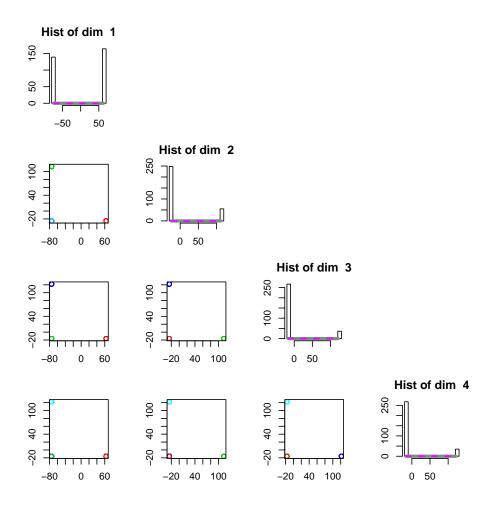

> missingValues(model)

```
[[1]]
```

row col value
[1,] 167 7 1
[2,] 193 7 2
[3,] 288 7 2
[4,] 303 7 1
[5,] 88 8 3
[6,] 267 8 3
